

Sunney always offered the best opportunity and environment to his students. We enjoyed wonderful studies of the systems biology of *Methylococcus capsulatus* (Bath) and the discovery of bacterial hemerythrin. He encouraged me to pursue the research of membrane protein, led me into the field of bioenergetics and structural biology. After I left the Chan group, we had kept in contact for eighteen years and there was always something new to learn from him. Now it is really time to say adieu. I am deeply in debt for all the fundamentals Sunney established.
